

Project Title: Financial Performance Dashboard: Superstore Sales Analysis

Overview: Developed an ETL pipeline and Power BI dashboard to analyze Superstore's financial performance, using MySQL, Python (Pandas, NumPy, Matplotlib), and Excel to deliver actionable insights for optimizing sales and profit strategies.

Skills Demonstrated: ETL (MySQL/Pandas), EDA (MySQL/NumPy), data visualization (Power BI/Matplotlib), stakeholder communication, and business intelligence, aligning with requirements for data pipelines, reporting, and analytics.

Process:

- Extracted and transformed sales/profit data from a MySQL database, addressing missing values and inconsistencies.
- Performed EDA to uncover trends, such as Technology's 50.79% sales share (\$145.45k) and Central's low 13.86% profit.
- Built an interactive Power BI dashboard with slicers, visualizing sales by region, category, and monthly trends (e.g., 2015 decline, 2016 recovery).

Key Findings (your insights):

- Technology led sales at 50.79% (\$145.45k), while Furniture lagged at 6.44% (\$18.45k).
- West region contributed 37.86% of profit (\$108.42k), with Central at 13.86%.
- Sales/profit declined in 2015, recovering in 2016, indicating market fluctuations.

Impact: The dashboard reduced reporting time by 15% (estimated) and enabled stakeholders to address underperforming areas like Furniture and Central, demonstrating business intelligence value.

Tools: MySQL, Power BI, Python (Pandas, NumPy, Matplotlib), Excel.

Deliverables: Interactive Power BI dashboard, MySQL queries, Python scripts, Matplotlib plots, Excel insights, and a stakeholder report.
